The Synthetic Rubber Industry in the Czechoslovakian Republic

of selective calcium-nickel-phosphate catalyst for the hydration of butane into butadiene. The catalyst ensures a polymerization depth of 30% in butadiene at a 90% selectivity and will be used in the second stage of the synthetic rubber plant being built in Kralupy. The first stage of plant construction has begun and will be completed by 1965, the second stage by 1965. At the same time, a plant is being designed for the production of chloroprene rubber to be produced from acetylene obtained by the partial oxidation of methane. By 1965, the rubber consumption per head of the population will be brought to 6 kg; by 1970, this figure will reach 10 kg. In order to develop the rubber-manufacturing industry in Czechoslovakia further, it is important to investigate some of the problems involved in the production of stereo-regular types of rubber. ✓

TITLE: Algorithm for the optimum layout of a pattern with round cutouts under limitations on the distance between pairs of cutouts

SOURCE: Kibernetika, no. 3, 1965, 77-83

TOPIC TAGS: metal stamping, computer programming, computer application

ABSTRACT: An algorithm and specialized digital computer program are developed for the problem of locating round holes of given arbitrary radii on a rectangular blank where there are limitations on the distance between pairs of holes and between the holes and the perimeter of the blank. The general problem and two examples of specific computer solutions are discussed: (1) optimum location of a group of holes of different diameters in the smallest possible rectangular blank when no spacing is required between holes or between them and the perimeter; and (2) the same problem with the holes separated by given distances from each other and the perimeter of the blank. Orig. art. has: 4 figures, 28 formulas.

TITLE: Optimum distribution of circular patterns

SOURCE: Kibernetika, no. 4, 1965, 70-75

TOPIC TAGS: cybernetics, computer program, probability

ABSTRACT: In an earlier paper (Kibernetika, no. 3, 1965) the authors investigated the problem concerning the optimum distribution of circular patterns of arbitrary radii for given minimum permissible distances between each of the pairs. A solution with a minimum area of the underlying rectangle is sought. In the present problem n circular patterns are given with arbitrary radii and a strip of material (of width 1) with n circular openings with arbitrary radii. The n patterns should be distributed across the strip of material in such a way that the length h of the strip is a minimum. The paper outlines the detailed formulation of the problem leading to a computer program. The method of solution, the procedure for the determination of the global maximum, and the generator of random numbers have all been described in the earlier paper. The authors conclude

TITLE: Recognition of nonintersection of special forms of geometric figures

SOURCE: Kibernetika, no. 6, 1965, 85-94

TOPIC TAGS: geometry, geometric form

ABSTRACT: The author considers ^{15, 44, 55} necessary and sufficient conditions for nonintersection of various types of geometric patterns. Special cases are considered for the absence of common points in various combinations of line segments, circles and arcs of circles. The following theorems are proposed and proved: 1. a given arc and circle do not intersect when and only when the circle of which the given arc is a part and the given circle do not intersect, or in the case where they do intersect the points of intersection are removed from the midpoint of the given arc by a distance greater than the length of the chord which subtends half the given arc; 2. two arcs do not intersect when and only when the circles of which they are part

UDC: 519.8

Card 1/2

do not intersect, or if they do intersect when the points of intersection are removed from at least one of the midpoints of the given arc by distances greater than or equal to the length of the corresponding chords which subtend half the given arc;
3. a given arc and a line segment do not intersect when and only when the straight line of which the segment is a part and the circle of which the arc is a part do not intersect, or if they do intersect when the distances from the points of intersection to the midpoint of the given arc are greater than the length of the chord which subtends half the given arc, or when the points of intersection lie outside the given arc. Examples are given illustrating application of these theorems. Orig. art. has: 7 figures, 2 tables, 51 formulas.

TITLE: Algorithms for constructing inequalities which are satisfied by the allocation parameters of intersecting bodies

SOURCE: Kibernetika, no. 5, 1966, 82-92

TOPIC TAGS: ~~cybernetics, bodies intersection~~, intersection condition, *algorithms*, *coordinate system*

ABSTRACT: The problem of the best (in a certain sense) distribution of bodies in a given domain (for example, the problem of miniaturization of electronic equipment) is reduced to establishing algorithms by which the condition for intersection of bodies can be automatically established. The six numbers $x, y, z, \psi, \phi, \alpha$ (ψ, ϕ, α are Euler angles) which determine the location of the relative coordinate system $X' Y' Z'$ with respect to a fixed coordinate system XYZ are called the parameters of the allocation of the body. The general form of the equation of the allocation of the body and the general conditions for the intersection of two bodies are written. It is pointed out that the application of the derived intersection conditions to particular cases is associated with certain difficulties in connection with calculating the maximum of a certain function. The author describes algorithms for deriving the intersecting conditions for spheres, polyhedrons, right circular

cylinders, the right frustum of a cone, and their combinations. For these particular cases, it is shown that the conditions of intersection of two bodies S_i and S_j can be represented by an inequality of the form $f_{ij} \geq 0$, where f_{ij} is an elementary function of allocation parameters of these bodies. Orig. art. has: 66 formulas and 7 figures.

TITLE: An apparatus for determining the abrasive wearing of alloys at high temperatures

SOURCE: Zavodskaya laboratoriya, v. 30, no. 9, 1964, 1137-1138

TOPIC TAGS: alloy abrasion, metal durability/ Kh25N12T steel, 30Yu6 alloy, 30 Yu16 alloy, 30 Yu 20 alloy, Kh18N9T steel

ABSTRACT: An apparatus, shown in Fig. 1 on the Enclosure, was developed for studying abrasive wearing of alloys at temperatures up to 1200C. Here (1) is a resistance oven, (2) is a cover, (3) is rotating bar, (4) is self-centering disk with three holders (diameter 10.1 mm and depth 10 mm) for three round (diameter 10 mm and length 20 mm) specimens, (5), (6) are chromomagnesium abrasive, (7) is an air-cooled breech, (8) is gearing, (9) is a thermocouple for oven temperatures. The temperatures and rotation velocity for testing can be varied through broad limits. Losses through sample abrasive wearing are determined by the formula: $\Delta G = q \frac{10}{F_1}$, where

ΔG is the loss in weight of the specimen in grams with 1 m² of exposed alloy surface per hour; q - the mean magnitude of abrasive wearing of three specimens

Card 1/3

ACCESSION NR: AP4044902

(loss measured in milligrams), P - area of exposed specimen surface in square centimeters, and τ - time of testing in hours. A plot is presented showing the temperature dependence of abrasive losses for three aluminum alloys tested at fixed rotation velocity, fixed normal load, and through the temperature interval from 700 to 1100°C. The tests indicate that increased aluminum content yields better abrasion resistance. Orig. art. has: 2 figures and 1 equation.

2114. POPMICHAILOV D. and STOYANOV D. *X-ray diagnosis of der-
moid cysts - teratomas (Bulgarian text) KHIRURGJA (Sofia)
1956, 9/7-8 (619-628) illus. 8

After a short review of dermoid cysts - teratomas, based on statistical data, the X-ray symptoms are considered and 4 personal cases are described. In 3 patients, the process was previously diagnosed, in 2 it was confirmed by operation. The third patient, whose X-ray picture clearly showed teeth and bones, rejected operation. The difficulties of the differential diagnosis are discussed and it is pointed out that besides the X-ray symptoms, the typical diagnosis is also of great significance. It is emphasized that erroneous conclusions are most frequent in the presence of Echinococcus. It is finally assumed, that the diagnosis of dermoid cyst, in spite of its difficulty, is possible by a methodical X-ray examination.

TITLE: Effect of born drugs on experimental atherosclerosis 22

SOURCE: Suvremenna medicina, no. 11, 1985, 667-673

TOPIC TAGS: drug effect, experiment animal, cardiovascular system, preventive medicine, therapeutic medicine

ABSTRACT: Study of effects of linotal (ethyl ester of higher unsaturated fatty acids of cottonseed oil), hyposterol (phenylethylacetate) and the pure saponin escin, and the total aqueous extract of wild chestnut, on experimental atherosclerosis in rabbits and rats. All of the above preparations showed varying degrees of effect either preventively, therapeutically or in both ways. Orig. art. has: 2 figures and 1 table. 14, and when dry fodder was fed to them, there were 3 contractions within a 5 minute period. The increase in the number of contractions may be ascribed to the decrease in the duration of the cycle, which occurred because the intervals between the contractions were shortened. The appearance and the smell of food caused an increase in the number of cycles within a certain period of time. When the animals ruminated and drank water, the number of R contractions decreased during a 5 minute period, since longer cycles developed due to the decrease of the intervals between the contractions. During milking and udder massaging the number of contraction did not change. However, a

Title : The Distribution of Nitrogen Substances Among Infusorians,
Bacteria, and Food in the Content of the Rumens in Cows.

Orig Pub : Izv. In-ta eksperim. vet. med. Bulg. AN, 1956, No 5, 145-153

Abstract : There was about 3.80 ± 0.4 percent of dry substances in the rumen of cows, regardless of diet, and fluctuating between 2.5 percent and 5.68 percent. Of these about 0.153 ± 0.014 percent contain nitrogen which fluctuates between 0.087 percent and 0.210 percent. A nitrogen content of 19.3 ± 1.5 percent is created at the expense of infusorians, that of 6.7 ± 0.6 percent magnitude at the expense of bacteria. The variation coefficient of infusorial nitrogen amounted to 31 percent, and of bacterial nitrogen to 27.1 percent. On the average, infusorians numbered 256 ± 35 thousand per

126-2-7/30

TITLE: Theory of the residual electric resistance of interstitial alloys. (Teoriya ostatochnogo elektrosoprotivleniya splavov vnedreniya).

PERIODICAL: "Fizika Metallov i Metallovedeniye" (Physics of Metals and Metallurgy), Vol.IV, No.2, 1957, pp.228-231 (U.S.S.R.)

ABSTRACT: Up to now authors have dealt mainly with the theory of the residual electric resistance of substitution type alloys (1-6). The aim of this paper is to investigate the relations governing the residual electric resistance of interstitial alloys as a function of the composition, the distant order parameters and the correlation parameters (which characterise the near order relations) between the substituted atoms of various types of nodes and interstices. The calculation was effected on the basis of the multi-electron theory, using a method which was described by this author and his team in other work (3-5). The following simplifying assumptions were made: the potential energies of the conductivity electrons differ little in the field of the ions of the differing type which substitute the nodes of the lattice and that the potential energies in the field of the ions which

Card 1/3

Theory of the residual electric resistance of interstitial alloys. (Cont.)

126-2-7/30

penetrated into the interstices are so small that they can be considered as small disturbances. These assumptions are not valid for all the interstitial alloys but they are quite serviceable for obtaining solely qualitative results. The authors consider an ordering alloy which has ions of various types in the nodes of the crystal lattice α ($\alpha = 1, 2, \dots$) and ions of the type β ($\beta = 1, 2, \dots$) in the interstices. For determining the residual electric resistance of the alloy, the authors used the method of the matrix density W_{nm} which is based on the zero approximation wave functions. The electric resistance is calculated for the particular case of a substitution alloy consisting of two metals A and B into the interstices of which atoms C of one type have penetrated. In the case of low concentrations of the penetrated atoms, the residual resistance was determined without considering correlation; in this case the admixture of the penetrated atoms causes an additional resistance which is proportional to the number N_C of the atoms C and brings about a shift in the concentration curve of the residual resistance by a constant value $\delta \rho_0$.

Title : Influence of Injected Atoms on the Ordering of the Alloy

Orig Pub : Fiz. metallov i metallovedeniye, 1956, 2, No 3, 584-590

Abstract : The influence of admixture of injected atoms on the ordering of an alloy, having a volume-centered cubic lattice, was investigated periodically. It was shown that the presence of an admixture of injected atoms increases the degree of ordering of the alloy and increases the ordering temperature. The possibility of ordering the disordered alloy by injecting admixture atoms into the interstices of its crystalline lattice is clarified. The distribution of the injected atoms of the admixture over the interstices of a different kind in the ordering of the alloy is investigated.
